Elegant design meets modern home security

Multi-functional door panels with stainless steel pilaster strips from Rodenberg

In order to protect their own four walls from unbidden guests, more and more house-owners invest in front doors with security features. Rodenberg AG meets the growing safety concerns with multi-functional door panels which integrate different communication and safety components and thereby allow an electronic monitoring of the entrance. Given the increasing demand the company has extended its product range in this special segment. The model range has now been completed by multi-functional door panels with fine stainless steel pilaster strips. These models impress with appealing design and at the same time offer protection from uninvited guests right at the front door.

Video camera protects from unbidden guests

The doorbell is ringing and who is there? – This question is easily answered thanks to a multi-functional door panel with integrated video surveillance. Apart from door intercom and video camera the panels are equipped with convenient controls like bell push and nameplate. As soon as the doorbell rings, the camera tapes the visitor and transmits

the recording to an indoor color screen. Without being seen, each resident can thus identify the visitor and, if necessary, keep the door

closed. For those who prefer more comfort the video-intercom device can be equipped with additional electronic components by a certified electronics specialist. The communication signal can be transmitted to a phone, for example, or the recording of one's visitor can

go directly to a TV. While watching TV one can easily check who is at the door – without opening it.

Side part including home security

In addition to safety and protection the communication and security elements of multi-functional door panels offer further advantages: They blend shapely into the door, where, at the same time, they are placed under ergonomic aspects. Thereby a visitor can easily handle them.

Nonetheless the single components are very well protected against vandalism. This applies as well to an alternative solution offered by Rodenberg: a compact functional unit including video camera, intercom, bell push and name plate, which is integrated into the door's side part. Available for slim as well as wide side parts, these components of stainless steel, synthetic or aluminium can be combined with any panel. They

contribute to a harmonious and coordinated look of the entrance because they integrate the otherwise separately installed communication devices.

Stainless steel pilaster strips add highlights

How to conciliate technical functions with modern design is illustrated by the extended model range of multi-functional panels. Looking at the numerous possibilities to design closed door panels - i.e. without light cutouts -

Rodenberg adopts a current trend by offering stainless steel pilaster strips. The vertical or horizontal 10 mm wide pilaster strips structure the doors and give them a clear, elegant look.

These stylish design elements are particularly shown to their advantage when combined with surfaces designed according to customer

specifications, available in all RAL colors or with 115 color or decor foils. Also, certain parts of the panel can be accentuated in color.

Pilaster strips refine the multi-functional panels visibly and haptically because they are slightly raised to the panel surface. Thus, quality is not only visible but also tangible. With this innovation Rodenberg proves once more that the possibilities of furnishing door panels with additional functions have in no way been exhausted.
